Primary Examiner, Art Unit 1797

An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the issue fee.

The application has been amended as follows:

In the Specification

The title was changed to: -- Process for Aerobic-Thermophilic Stabilization and Disinfection of Sludge --

The following is an examiner's statement of reasons for allowance:

USP 20080073266 to McWhirter is cited of interest.

McWhirter describes a process for the stabilization and disinfection of sludge wherein raw sludge (after thickening, 38) having a dry matter content of "at least about 3% by wt. solids" [0017] is fed into the first of two ATAD ("autothermal aerobic digestion") reactors 24. The sludge remains in the first ATAD reactor for an average retention time of 5- 10 days [0017] under aerobic-thermophilic conditions to obtain a partially stabilized sludge. Partially stabilized sludge is fed from the first-stage ATAD reactor into a second stage during which disinfection of the partially stabilized sludge is effected at temperatures of 55 – 65°C.

McWhirter states that the ATAD reactors are operated in "batch mode" and "are not operated in a continuous flow manner" [0017]. The ref. states that feeding is intermittent, with removal of digested solids from the second tank, transfer of digesting solids from the first to the second tank, and addition of feed solids to the first tank. McWhirter recognizes that this feeding and transfer mode promotes temperature elevation and minimizes short-circuiting of feed solids to the stabilized solids, thereby enhancing pathogen destruction.

McWhirter does not describe continuously or "quasi-continuously" feeding the first tank while processing the second in batch mode.

McWhirter shows another embodiment depicted in Fig. 4.

Fig. 4

In this embodiment, raw sludge is fed continuously through multi-stage aerated thermophilic reactors 30-34 then to one of two alternating batch aerobic (middle [0055]) thermophilic batch pasteurization reactors 36. Accordingly, ATAD stages 30 – 34 are continuously fed with raw sludge of unspecified solids concentration. Partially stabilized sludge from ATAD 30-34 is fed discontinuously to one of two alternating Batch pasteurization reactors 36. While the batch pasteurization reactors can be aerated (middle [0055]), it is unclear at what temperature the batch pasteurization reactors are operated. See [0051] – [0055].

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
